and Cases

Chart 1.--Distribution of average monthly number of cases during 1933 in agencies administering general relief in 41 urban areas

## DIFFERENT TYPES OF CASES IN FAMILY-WELFARE AND RELIEF AGENCIES

Wide variations in the proportion of cases receiving relief, service of different types, and neither relief nor service are shown in the monthly reports of family-welfare and relief agencies in the registration areas, the only areas for which this information is assembled in the Bureau's reporting project (charts 1 and 2, table 1).

In public agencies administering general relief about four-fifths of the average monthly number of cases reported in both 1932 and 1933 were those under care and receiving relief. In private agencies administering such relief the proportion was smaller—about two-thirds in nonsectarian and Catholic agencies, one-half in Jewish agencies, and two-fifths in the Salvation Army and in a group of various other types of agencies.

Cases under care and receiving service but no relief during the month formed about 20 percent of the average monthly number reported during these years by Jewish agencies. In the Salvation Army the proportion was about 5 percent. In public agencies, nonsectarian family agencies, Catholic agencies, and other private agencies, the proportion ranged between 10 and 14 percent.

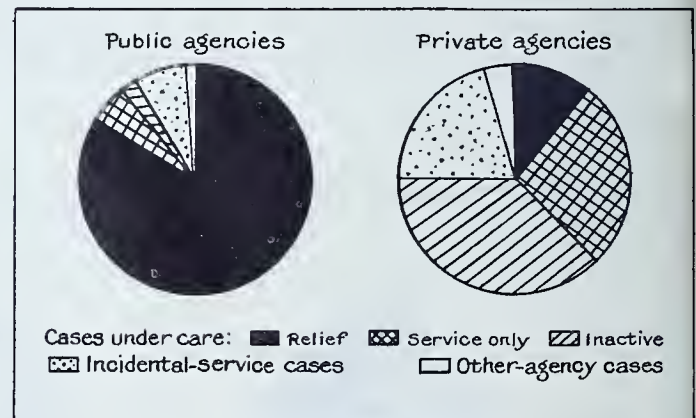

In public agencies administering general relief about 6 percent of the average monthly number of cases were classified as under care although receiving neither relief nor service during the month of the report. These inactive cases formed about 7 percent of the total in Catholic agencies in 1933. In nonsectarian and Jewish agencies and also, in 1932, in Catholic agencies the proportion was between 10 and 12 percent. In the Salvation Army and in the group of other private agencies it was much larger.

Approximately 5 percent of the cases in public agencies administering general relief were classified as incidental-service cases in both 1932 and 1933. In nonsectarian, Jewish, and Catholic agencies the proportion was between 7 and 15 percent; in the Salvation Army and in the group of other private agencies, 21 percent or more. Usually little or no relief was

given to these cases, but in certain instances many or all received relief. Because of the wide variation in the classification of incidental-service cases, a separate count was discontinued in Bureau reports in 1934, and those previously classified under this heading are combined with those reported as under care.

Cases involving service to another agency, such as those investigated on the request of an out-of-town agency, formed less than 1 percent of the average monthly number of cases reported by public agencies administering general relief. In private agencies the proportion was between 3 and 5 percent.

Chart 2.—Distribution of average monthly number of cases during 1933 in agencies administering veterans' relief in 40 urban areas

A large proportion (83 percent) of the average monthly number of cases in public agencies administering veterans' relief was classified in both 1932 and 1933 as under care and receiving relief. In private agencies the proportion of these cases was much smaller (11 percent). Cases under care and receiving service only formed about one-third of the cases reported by private agencies. In public agencies the proportion was about the same as in agencies administering general relief. The proportion of inactive cases was large in private agencies caring for veterans and unusually small in public agencies.

Table 1.—Average monthly number of different types of cases during 1932 and 1933 in agencies administering general and veterans' relief in 41 urban areas

## STAFF AND CASE LOADS IN FAMILY-WELFARE AND RELIEF AGENCIES

The changes during the latter part of 1933 in the relief programs of public and private agencies in various sections of the United States are reflected in the monthly reports from the registration areas on the number of staff members and the number of cases per case worker in different types of family-welfare and relief agencies (table 2 and chart 3).

In public agencies administering general relief the average monthly number of case workers was nearly three times as large in 1933 as in 1932, and the number of administrative and clerical workers, nearly

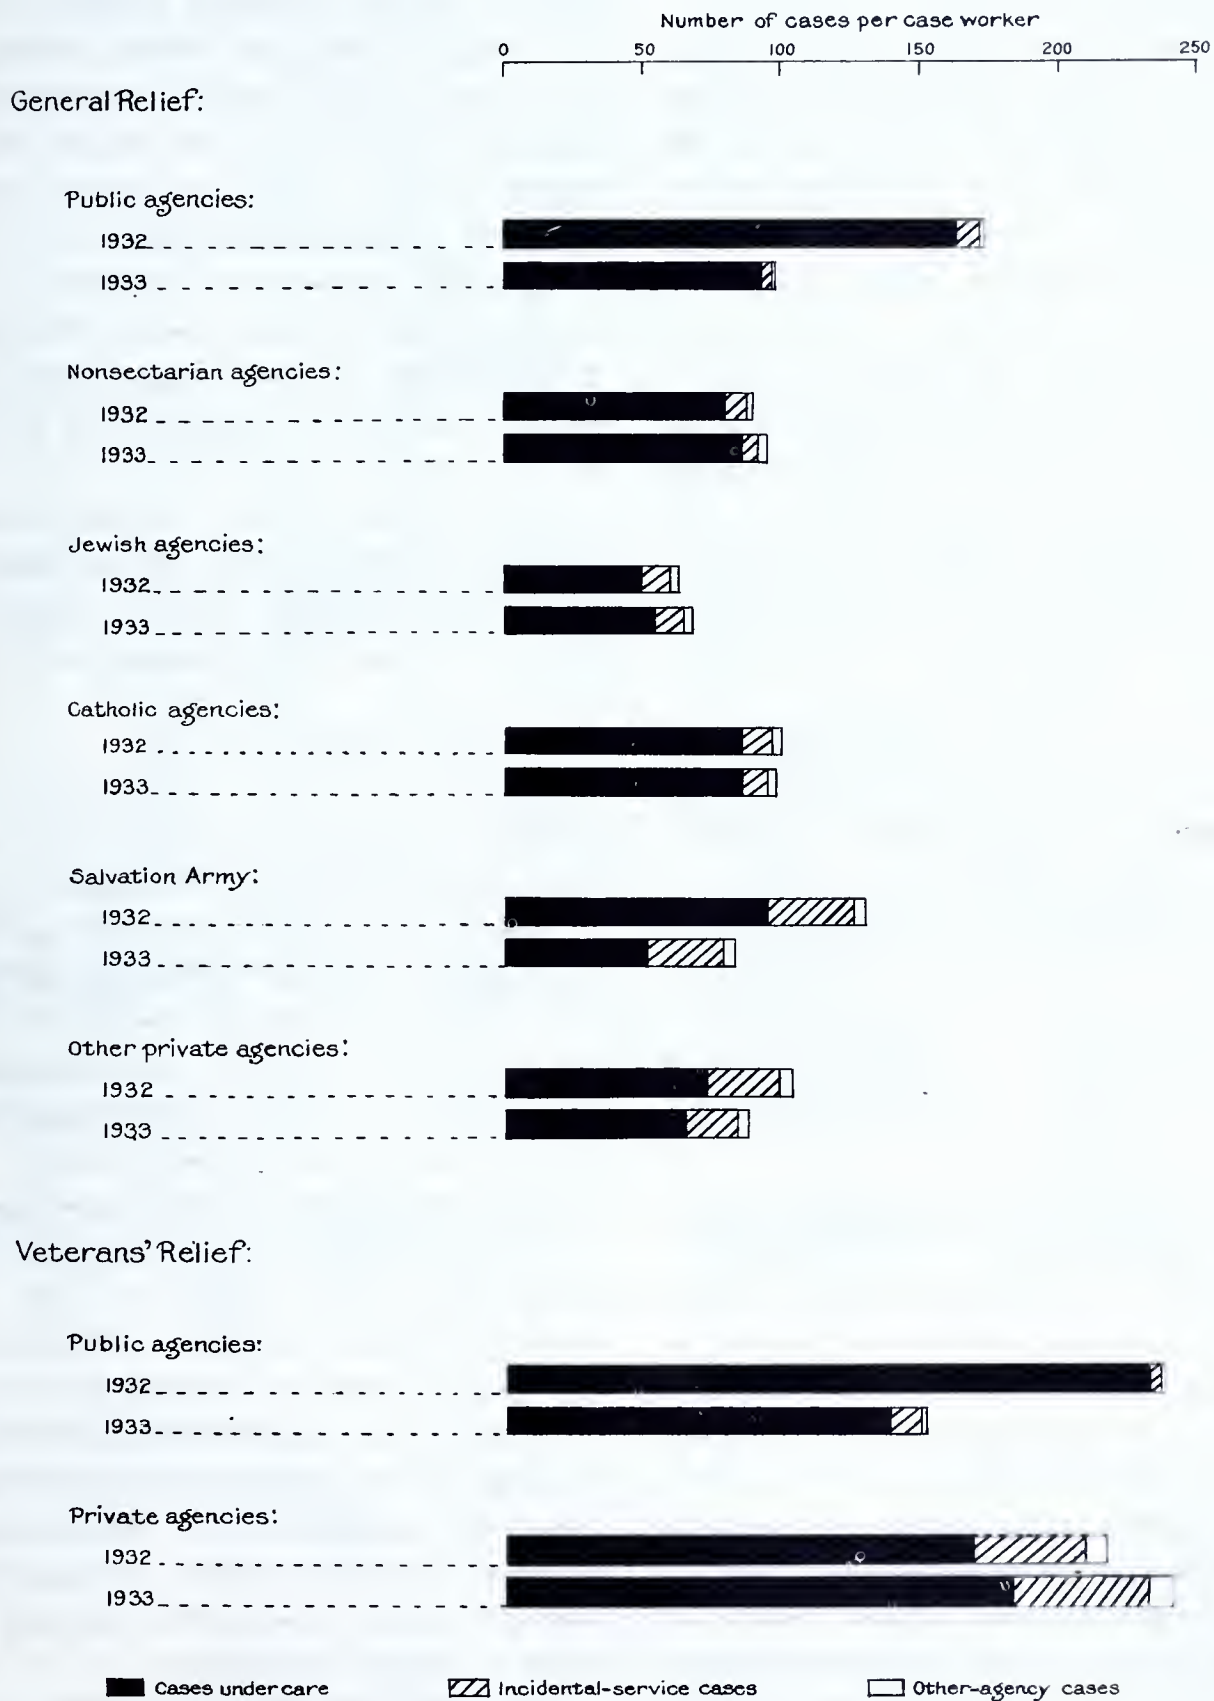

twice as large. In public agencies administering veterans' relief the number of administrative and clerical workers also nearly doubled in 1933, but the number of case workers increased only two-thirds.

Significant increases in the number of staff members were reported in 1933 by Catholic agencies and a group of other types of private agencies. In nonsectarian agencies and in private agencies administering veterans' relief the trend in 1933 was downward. The number of staff members in Jewish agencies and the Salvation Army remained relatively unchanged. (Continued on page 6.)

Chart 3.--Average monthly number of cases of different types per case worker during 1932 and 1933 in agencies administering general and veterans' relief in 41 urban areas

(Continued from page 4.)

The average monthly number of cases per case worker varied in different types of agencies. There were also significant changes in certain agencies between 1932 and 1933.

In 1932 the case load in public agencies administering general relief was large--173 cases per case worker. As was noted above, very few of these cases were inactive during the month of the report and the number of incidental-service cases was also small.

The distribution by type of case changed only slightly in these agencies in 1933, but the marked increase in case workers as compared with the increase in cases reduced the average monthly case load to 98. This was approximately the same as the case load in nonsectarian and Catholic agencies in both years and in the Salvation Army and the group of other private agencies in 1933. In Jewish agencies the case load was much less in both 1932 and 1933.

In public and private agencies administering veterans' relief the case loads were large in both years as compared with those in public and private agencies administering general relief.

Changes in case loads between 1932 and 1933 were as follows. In public agencies administering veterans' relief and in the Salvation Army the case load dropped in 1933, although less rapidly than in public agencies administering general relief. Comparatively small decreases were reported in Catholic agencies and in the group of other private agencies. In nonsectarian and Jewish agencies and in private agencies administering veterans' relief the trend was upward in 1933.

Detail on cases, staff, and case loads will be presented separately by area for each type of agency in the 5-year summaries for the social-statistics project in preparation for publication.

#### JUNE CHANGES IN RELIEF EXPENDITURES AND CASES

Expenditures from public and private funds for various types of relief decreased about 5 percent between May and June in a group of representative urban areas of 50,000 or more population. Between April and May the amount expended for relief in these areas increased about 8 percent. The June expenditure was slightly more than in April, and 39 percent more than in June 1933 (tables 3 and 4).

This year's decrease in total expenditures between May and June was similar to that reported in preceding years with the exception of 1932. In 1929 the reduction between May and June was 5 percent; in 1930, 6 percent; in 1931, 7 percent; and in 1933, 3 percent. In 1932 the amount expended in June was practically the same as in May.

About 91 percent of the total amount expended in both May and June of this year was for direct and work relief financed from public funds. Such relief decreased between May and June slightly more rapidly than total relief with its relatively unchanging volume of expenditure for special allowances. The rise between June 1933 and June 1934 was also more rapid

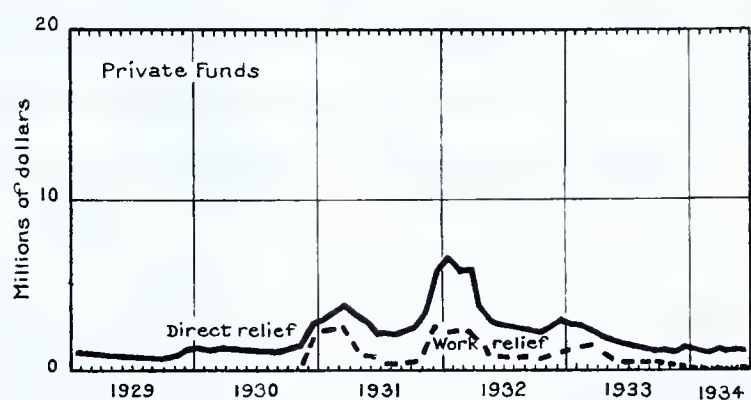

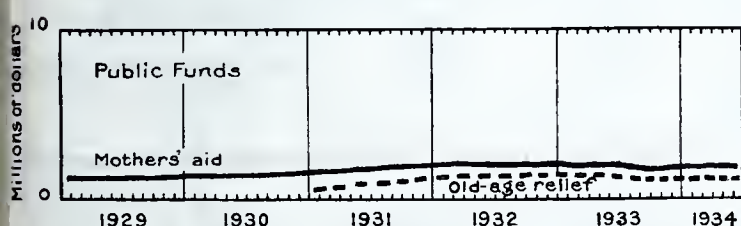

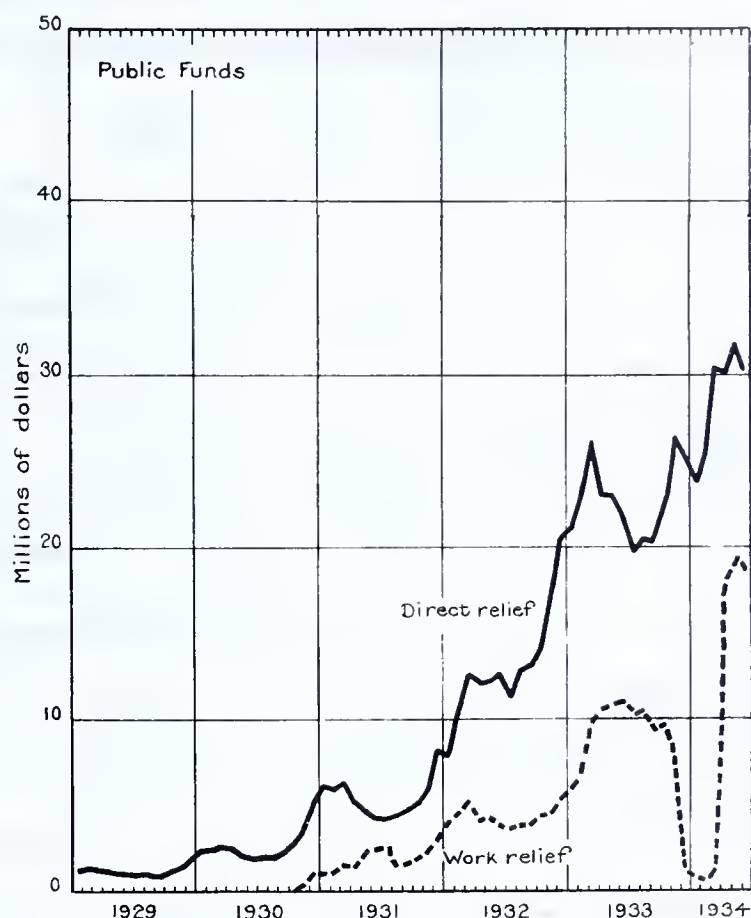

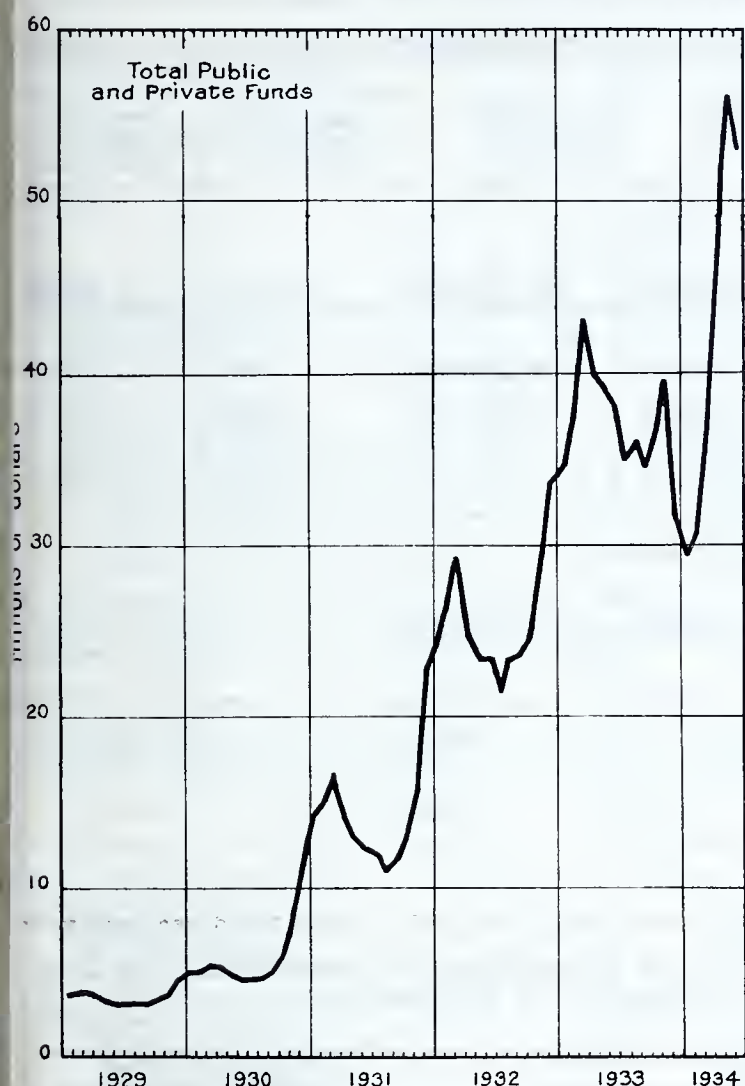

in expenditures from public funds for direct and work relief than that shown for total relief.

All types of general relief administered by private agencies decreased between May and June. In Jewish and Catholic agencies the reduction was less than in public agencies; in nonsectarian agencies, slightly more; and in the Salvation Army and the group of other private agencies, much more.

Last year in June a considerable proportion of the relief administered by private agencies in certain areas was financed from public funds. The decrease of 78 percent between June 1933 and June 1934 in the amount expended by private agencies was due partly to the change in such arrangements under the requirement of the Federal Emergency Relief Administration that unemployment relief from public funds be administered by public agencies. The amount expended from private funds, however, also decreased markedly between June 1933 and June 1934.

The provision of old-age relief in certain additional areas in June increased expenditures for this purpose. June expenditures for aid for the blind

Chart 4.--Amount expended from public and from private funds for different types of relief in 120 urban areas, January 1929-June 1934

also showed an upward trend. The amount expended for mothers' aid was slightly less in June than in the preceding month, although more than in June 1933.

In all types of general relief the number of cases aided decreased somewhat less rapidly between May and June than the amount of the expenditure, with the result that the average monthly relief per case was slightly less in June. The average for mothers' aid and old-age relief also decreased. Veterans' relief and aid for the blind increased (table 5).

As compared with June 1933, the average monthly amount of relief provided per case was much larger in public agencies administering general and veterans' relief and in nonsectarian agencies. Small increases were reported in Jewish agencies, in the group of other private agencies, and in private agencies administering veterans' relief. The average decreased in Catholic agencies and the Salvation Army. A downward trend was shown in the averages for mothers' aid, old-age relief, and aid for the blind.

(Continued from page 7.)

In 34 of the 103 areas forwarding reports in time for tabulation, total expenditures for public and private relief decreased 10 percent or more between May and June (table 6). Increases of 10 percent or more were reported in 15 areas. The median change was a reduction of 2.2 percent.

An increase of 100 percent or more in relief expenditures between June 1933 and June 1934 was reported in 18 areas. In 28 areas the rise was between

50 and 100 percent, and in 23 areas, between 25 and 50 percent. The median change was an increase of 42.7 percent.

The average daily number of meals and lodgings provided to homeless and transient persons increased slightly between May and June (table 7). Between April and May the number decreased about 5 percent. In preceding years the trend in June has been downward.

Table 6.--Amount expended for relief during June 1933, May 1934, and June 1934, and percentage from public and from private funds, as reported by 937 agencies for 103 urban areas

[Urban areas included in this table are those for which reports from public and private agencies are believed to be sufficiently complete for use in determining local trends. Figures are preliminary and subject to revision.]
